	Developer	Alexander Jon Solis
	Researcher/ Technical Writer	Sean Maverick Virata

BUSINESS CASE

Identified Problem:	Altea Private Resort is experiencing pencil bookings, double bookings, and customer scams.		
Root Cause Analysis: (5 WHYs or Fishbone Analysis)	<pre> graph TD A[Altea Private Resort is experiencing pencil bookings, double bookings, and customer scams.] -- Why? --> B[Booking verification is weak and inconsistent.] B -- Why? --> C[The current booking process utilizes the manual and traditional process (e.g., chat, messages).] C -- Why? --> D[There is no centralized system that allows the admin and employees to track, validate, and confirm bookings in real time.] D -- Why? --> E[There is no dedicated booking and verification system to manage the reservations, confirmation of payments, and prevent fake bookings or double bookings.] </pre>		
Problem to be solved: (Root cause)	There is no dedicated booking and verification system to manage the reservations, confirmation of payments, and prevent fake bookings or double bookings.		
Objectives:	General Objective:	To develop a web-based self-booking system for Altea Private Resort that will help improve booking verification, manage reservations, and reduce operational issues such as scams, pencil bookings, and double bookings.	
	Specific Objectives:	Reduce the occurrence of pencil bookings, double bookings, and customer scams through a centralized booking system.	
		Improve the verification of bookings through a self-booking appointment confirmation system with proof of payment and admin validation.	
		Provide the clients with a web-based platform to book their preferred dates and time slots, and to view its availability.	
		Enable the admin to monitor, confirm and manage bookings with efficiency using an integrated calendar and user-friendly booking dashboard.	
		Generate booking reports and analytics to support better business and marketing decisions.	
Project Team Resources: (Feasibility)	Human Resource:	Knowledge:	• Operation of Altea Private Resort • Booking process • System requirements

BUSINESS CASE

		Skills:	• Python, HTML, CSS, JavaScript programming • SQL database design • Technical writing • Logical diagrams
	Technical Components:	Front End: (Programming Language)	• Jinja HTML • CSS • JavaScript programming
		Back End: (Database Application)	• Python Flask • Supabase
	Budget (if applicable)	Proposed Budget:	
System Features:	User Authentication & Account Management Module: Handles user registration, login, password management, and Role-Based Access Control (RBAC).		
	Public Website Module: Displays an attractive and user-friendly interface that contains resort information (contact details, booking guidelines, rates, and policies).		
	Booking & Payment Module: Permit clients to select their preferred and available dates, make advanced bookings, and manage pencil bookings. It also handles booking confirmation, cancellation, and status updates.		
	Calendar Integration Module: Integrates with Google Calendar to prevent double bookings, display bookings, and allow admin verification and management regarding the booked date.		
	Notifications: Sends email notification in regards to booking submission, payment verification, and booking confirmation or rejection.		
	Admin Management Panel Module: Provides tools for admin to view/manage bookings, confirm/reject payments, manage calendar availability, and override booking statuses if needed.		
	Data Analytics Dashboard Module: Displays the monthly booking trends, most booked time slots, profit estimates, cancellation counts.		
	Accessibility & Platform Support Module: Ensures a responsive, web-based access from mobile devices, laptops, and desktops.
