

Retail Sales Trends

Sales Trends by Date

Management Memo:

Sales consistently fluctuate between roughly 0.6M and 1.0M on any given day, as confirmed by the daily Sales Trends chart for all three years. The most significant underlying pattern, however, is revealed by the 30-day moving average: during the whole period, sales have remained largely range-bound between 72M and 78M, with no discernible continuous directional upward trend.

Surprisingly, the 30-day average reached a peak of about 78M in the second half of 2022, after which it declined and remained steady in the 74–76M range during 2023 and 2024. This implies that although the company's sales volume has remained comparatively steady, the growth momentum seen in early 2022 did not continue at the same rate. This pattern is reflected in the 7-day moving average, which exhibits periodic cyclical fluctuations without a discernible rising trend.

Crashes in daily sales are unfortunately common and do not indicate structural issues. The 30-day trend collapsed over the last two years, though, and leadership should look at whether this is a sign of seasonal normality, market saturation, or a chance for focused growth activities to rekindle upward momentum. These upsets in market sales cannot easily be spotted using the typical sales trend line chart due to the nature of the market sales frequently fluctuating. However, these can easily be spotted with using moving averages such as the drop visible on December 14, 2022 with the seven day moving average, when sales dropped to 67.35M which is also the data's all time low.
