

Solis, Alexander Jon S.
BS Computer Science 3rd Year

Scenario	Classification
1. A quad-core CPU rendering video using all cores at the same time	This is Parallelism because all of the four cores are working together simultaneously on rendering the video.
2. One Cashier serving many customers by switching between them	This is an example of Concurrency as all customers are handled by only one cashier at a time.
3. Multiple printers printing different documents simultaneously	This is classified as Parallelism as each printer works independently at the same time.
4. A single-core CPU running music, browser, and chat apps	This is classified as an example of Concurrency as a single core processor can only run multiple tasks when the OS switches the usage of the core rapidly which is called context switching.
5. Four students solving different parts of a group project at the same time	This is an example of Parallelism as each student works simultaneously on separate parts which speeds up the completion of the task.
